Introduction

The Florida Agency for Health Care Administration (Agency) initiated collection of patient records for all ambulatory visits to a hospital Emergency Department (ED), beginning with visits in January 2005. The ED database provides a detailed look at the reasons people seek care at the ED, the charges and the payers for these visits, as well as the diagnoses and procedures performed in the ED setting. This report provides information about the acuity level (the severity of the visit) for all patients where the visit did not result in an inpatient admission.

Emergency Departments provide a significant source of medical care in the state of Florida, with over eight million outpatient ED visits occurring in 2014. Over 63% of all hospital inpatient admissions in the state of Florida last year originated in an ED facility. Many ED visits are potentially preventable, meaning that access to high-quality health care in a primary care setting can prevent the need for a portion of ED visits.

This report is submitted in accordance with Section 408.062, Florida Statutes, which reads:

- (1) The agency shall conduct research, analyses, and studies relating to health care costs and access to and quality of health care services as access and quality are affected by changes in health care costs. Such research, analyses, and studies shall include, but not be limited to:*
 - (i) The use of emergency department services by patient acuity level and the implication of increasing hospital cost by providing non-urgent care in emergency departments. The agency shall submit an annual report based on this monitoring and assessment to the Governor, the Speaker of the House of Representatives, the President of the Senate, and the substantive legislative committees with the first report due January 1, 2006.*

Patient Characteristics

Children, under five years of age, made nearly half of all pediatric ED visits. Forty-five percent of all pediatric ED visits were children four years old or younger (see Appendix Table 1). Children in this age group are more than twice as likely to visit ED as other pediatric age groups.

Medicaid was the principal payer for pediatric ED visits by a considerable margin, paying for 69% of all pediatric visits. Commercial payers were the second-highest payer at 19% (see Appendix Table 1).

Figure 1. Pediatric ED Visits by Sex, Race/Ethnicity, Age Group, and Payer Group

Women comprise 51% of Florida’s adult population¹, but they account for 59% of all adult visits to EDs (see Appendix Table 2). Florida’s adult women visit EDs at a rate of 450 visits per 1,000 population, while adult men in the state visit EDs at a rate of 325 visits per 1,000 population. Women were 38% more likely than men to visit EDs.

Figure 2. Adult ED Visits by Sex, Race/Ethnicity, Age Group, and Payer Group

Volume Trends over Time

Due largely to population growth, the volume of ED visits for all payers has historically increased every year. An interesting development over the past two years has been the significant decrease in the number of visits made by patients who are self-insured or under-insured. Uninsured Florida residents made 153,347 fewer ED visits in 2014 than they did in 2012. By comparison, uninsured Florida residents made 245,375 *more* visits in 2012 than they did in 2010.

Figure 3 shows the relative share of ED visits for each payer over the past three years.

Figure 3. Total Visits by Payer 2012-2014

Inpatient Hospitalization

In 2014, Florida residents made 9,789,267 ED visits with 1,732,126 (17.7 %) of those visits subsequently resulting in a hospital inpatient admission. An inpatient hospitalization resulted from 79,481 pediatric visits and 1,652,645 adult visits. Pediatric ED visits are less likely to result in inpatient hospitalization than adult visits. The inpatient hospitalization rate for pediatric visits was 4%, while the rate for adult visits was 21.2%.

Regardless of patient characteristics, the rate of pediatric ED visits resulting in inpatient hospitalization was much lower than the rate for adult ED visits (see Appendix Table 3). Charity, self-insured, and under-insured pediatric visits were less likely to be admitted for inpatient care than Medicaid, Medicare, or commercial payers for pediatric visits.

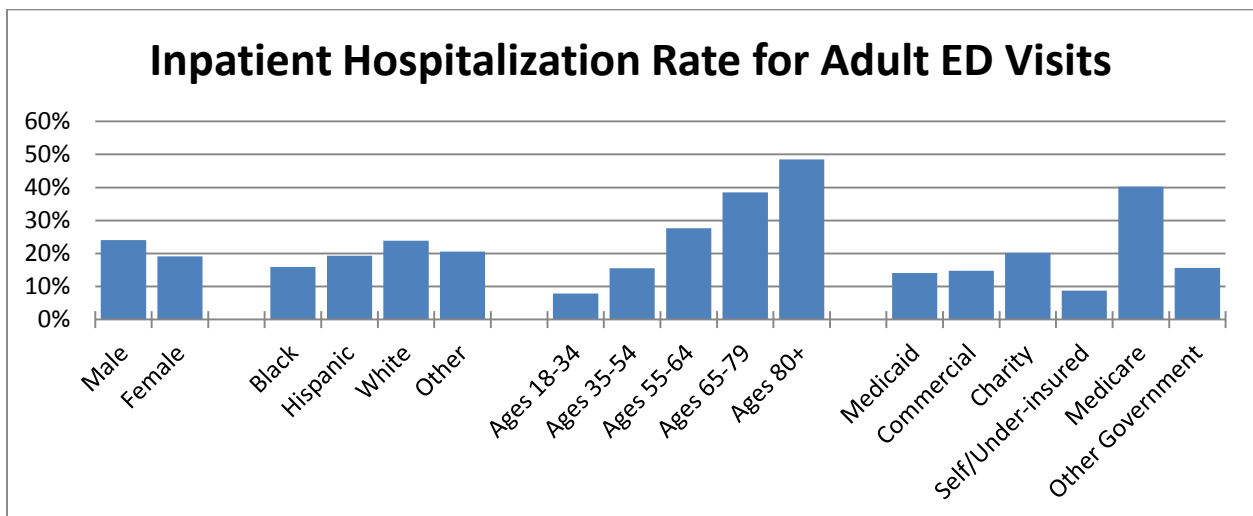

While 4.1% of pediatric visits with Medicaid, Medicare, Other Government, or Commercial principal payers resulted in inpatient hospitalization, only 1.9% of Charity, Self-insured, or Under-insured pediatric visits resulted in inpatient hospitalization. This rate is well below the statewide average of 4.0% pediatric hospitalization (see Appendix Table 3).

Figure 4. Inpatient Hospitalization Rate for Pediatric ED Visits by Patient Characteristics

Patient age is strongly correlated with an inpatient hospitalization following an ED visit. Older patients who visit EDs are considerably more likely to be hospitalized for their conditions. This phenomenon is most likely attributable to the types of conditions that bring patients to the EDs. Nine of the top ten most common medical conditions for inpatient hospitalizations overall are also among the most common conditions for patients over 65 (see Figure 13). Visits paid by Medicare are over three times as likely to result in inpatient hospitalization as other payers, most likely due to Medicare’s strong positive correlation with age (see Appendix Table 3).

Figure 5. Inpatient Hospitalization Rate for Adult ED Visits by Patient Characteristics

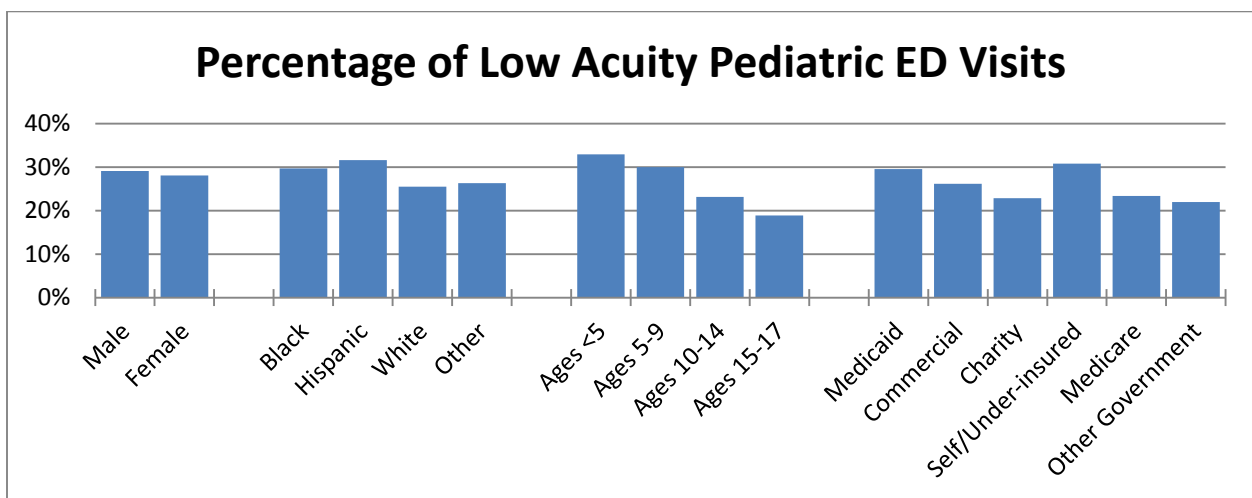

Patient Acuity

The Agency for Health Care Administration’s outpatient ED database includes Current Procedural Terminology, or CPT, Evaluation and Management codes, designed to categorize the acuity (severity) of a patient’s diagnosis. This grouping of management codes is detailed in the Appendix. The following analysis used these CPT codes to label outpatient visits as either high acuity or low acuity visits.²

Pediatric visits for young children were more likely to be low acuity visits. The rate of low acuity visits for children below five years of age was nearly 75% higher than the low acuity rate for children aged 15-17 (Appendix Table 4). Low acuity rates decrease for every increase in age group for pediatric visits.

Figure 6. Low Acuity Rate for Pediatric ED Visits by Patient Characteristics

The average charges for pediatric visits increase with age. For both low and high acuity visits, the average charge for a pediatric visit was much higher for the older age groups. The average low acuity charge for ages 15-17 was 44% higher than the statewide pediatric ED visit average low acuity rate of \$839. The average high acuity charge was 49% higher than the statewide average high acuity rate of \$2,567 (see Appendix Table 4).

² For a full definition of patient acuity, see Appendix, "[Definition of Patient Acuity.](#)"

Figure 7. Mean Charges for Pediatric ED Visits by Acuity and Patient Characteristics

ED visits by adult Hispanic patients were substantially more likely to be low acuity visits, and these visits were significantly more costly than the average visit. The low acuity rate for Hispanic adult patients (19.2%) was 36% higher than the statewide average. The mean charge for low acuity ED visits by Hispanic adults (\$2,858) was 76% higher than the statewide average for all low acuity adult ED visits (\$1,620) (see Appendix Table 5).

Figure 8. Low Acuity Rate for Adult ED Visits by Patient Characteristics

The average charges for adult visits also increased with age. For both low and high acuity visits, the average charge increased with age. Low acuity visits for patients above 80 years of age were over twice as costly as low acuity visits for the youngest adults. High acuity visits for patients over 80 years of age cost 67% more than high acuity visits for patients aged 18-34 (see Appendix Table 5).

Figure 9. Mean Charges for Adult ED Visits by Acuity and Patient Characteristics

Acuity Trends over Time

The number of ED visits per capita in Florida has increased markedly in the past decade³. ED visits per 1,000 population have risen 32% since 2005. However, the portion of those visits considered low acuity has been reduced by nearly 50% in that same timeframe. Although EDs are seeing more patients, the vast majority of visits are considered high acuity visits.

As seen in Figure 10 below, the low acuity rate for ED visits has decreased steadily since 2005, while the percentage of Floridians who lack health insurance has remained relatively unchanged. These two trends are not necessarily related, although uninsured patients are more likely to make low acuity visits to EDs than other types of patients (see Figure 8).

³ Unless otherwise noted, all analysis in this report examines the full dataset of ED visits in 2014. In order to maintain comparability with previous years' reports, the "Acuity Trends over Time" section examines only visits made by Florida residents.

Figure 10. Number of ED Visits Per Capita over Time by Acuity Level

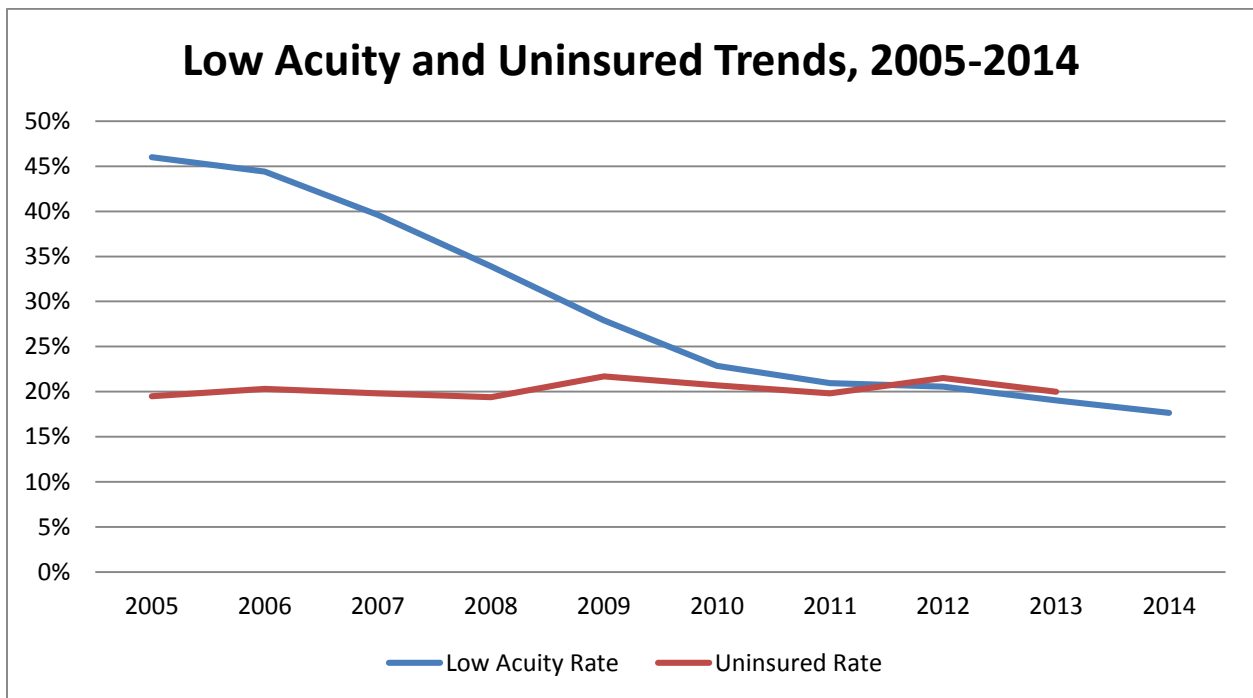

Figure 11. Percentage of Visits Considered Low Acuity Compared to Uninsured Rate

Top Medical Conditions

The following tables show the most commonly diagnosed medical conditions for both outpatient ED visits (Figure 12) and ED visits requiring inpatient hospitalization (Figure 13). The tables also show the average charge for each condition.

Figure 12. Top Ten Most Common Medical Conditions for Outpatient ED Visits

Outpatient Diagnosis	Percentage of ED Visits	Mean Charges
Other upper respiratory infections	5.7	\$1,816
Abdominal pain	4.9	\$8,093
Sprains and strains	4.8	\$3,374
Superficial injury; contusion	4.6	\$3,754
Nonspecific chest pain	3.6	\$11,490
Spondylosis; intervertebral disc disorders; other back problems	3.4	\$4,035
Skin and subcutaneous tissue infections	2.8	\$2,291
Urinary tract infections	2.7	\$5,354
Other injuries and conditions due to external causes	2.6	\$4,739
Headache; including migraine	2.5	\$5,234

Figure 13. Top Ten Most Common Medical Conditions for Inpatient Hospitalizations

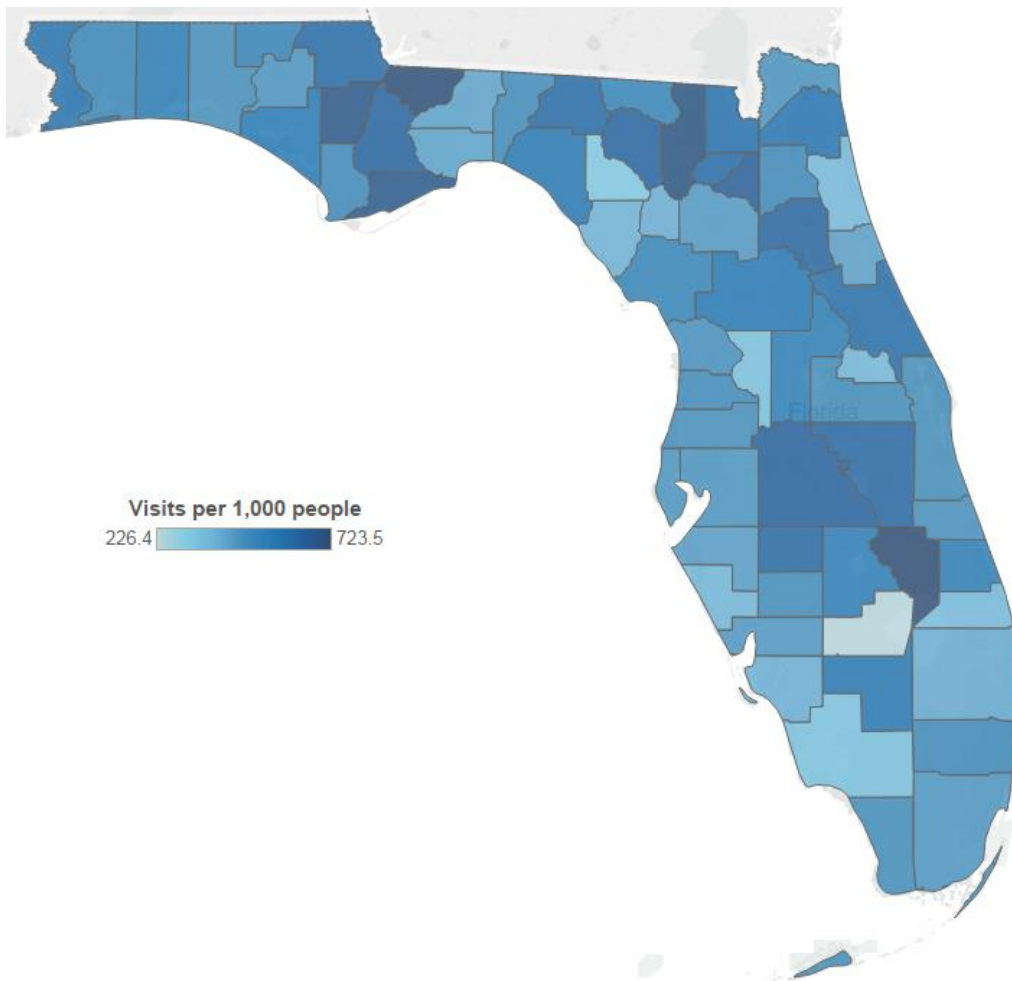

Inpatient Diagnosis	Percentage of Hospitalizations	Mean Charges
Septicemia (except in labor)	4.8	\$95,635
Congestive heart failure; non-hypertensive	3.6	\$50,640
Pneumonia (except that caused by tuberculosis or Sexually Transmitted Diseases (STD))	3.4	\$47,404
Chronic obstructive pulmonary disease and bronchiectasis	3.1	\$39,161
Cardiac dysrhythmias	3.0	\$44,423
Skin and subcutaneous tissue infections	2.7	\$33,650
Urinary tract infections	2.6	\$33,416
Mood disorders	2.6	\$18,550
Acute cerebrovascular disease	2.3	\$73,619
Acute myocardial infarction	2.3	\$100,663

Geographic Variation in ED Use

Figure 14 shows the number of Emergency Department visits per 1,000 people in each county in Florida⁴ (see Appendix Tables 6-7 for details). Visits are classified by the county of residence for each patient, not the county in which the facility is located. If a patient lives in Wakulla County but visits an ED in neighboring Leon County, for example, the visit is classified as a Wakulla County visit.

Frequency of visit is inversely correlated with a county's median household income⁵ ($R^2=0.43$). Residents of lower-income counties (10th percentile of median income or below) average 590 visits per 1,000 population, while residents of higher-income counties (90th percentile of median income or above) average 424 visits per 1,000 population.

Figure 14. ED Visits per 1,000 People by County

Definition of Patient Acuity

Emergency Departments use the following codes to report evaluation and management services. There is no distinction between new and established patients in the ED.

Low Acuity

99281 - Emergency department visit for the evaluation and management of a patient, which requires these three key components: a problem focused history; a problem focused examination; and a straightforward medical decision-making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually the presenting problems(s) are self-limited or minor.

99282 - Emergency department visit for the evaluation and management of a patient, which requires these three key components: an expanded problem focused history; an expanded problem focused examination; medical decision making of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually the presenting problem(s) are of low to moderate severity.

High Acuity

99283 - Emergency department visit for the evaluation and management of a patient, which requires these three key components: an expanded problem focused history; an expanded problem focused examination; medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually the presenting problem(s) are of moderate severity.

99284 - Emergency department visit for the evaluation and management of a patient, which requires these three key components: a detailed history; a detailed examination; medical decision making of moderate complexity.

Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problems are of high severity and require urgent evaluation by the physician but do not pose an immediate significant threat to life or physiologic function.

99285 - Emergency department visit for the evaluation and management of a patient, which requires these three key components within the constraints imposed by the urgency of the patient's clinical condition and/or mental status: a comprehensive history; a comprehensive examination; medical decision-making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problems(s) are of high severity and pose an immediate threat to life or physiologic function.
